

Ye Tally Rope...

Five knights are sitting around a round table. On the tables are 10 pegs. 5 fixed pegs in the middle in a ring. 5 variable pegs that move on a rail with markings. Around the pegs is a wire. The variable pegs now only can move towards the knight if one or more of the others are released.

Whenever the knight wants someone elses hammer, a horse, a shield... the pegs move. After a while we can read the exchange rate between horses, axes and shields of off the moving of the pegs.

Why?
